

ABSTRACT OF THE DISCLOSURE

A flat portable mixing sheet with handles for manually blending materials in heterogeneous phases, particularly dry and liquid materials into a homogeneous mixture. The materials to be blended will be placed in the center of the mixing sheet and the handles of the sheet will be pulled alternately upward and toward the center of the sheet to tumble the materials while supported on the ground or floor into the required consistency. The mixed materials can then be transported on the sheet by the handles and poured into the designated location utilizing the midpoint along the side of the sheet as a spout. The handles are preferably made of high density polyethylene and thermally bonded to the mixing sheet.
